The Company was founded in 1838 by the Scaglia family and remains in their ownership to the present day. It was the foundation stone of an important industrial group, which has now diversified into a wide range of commercial and manufacturing businesses, with plants and subsidiaries worldwide.

Internal Material Handling Experts

Today, Scaglia Indeva is recognised worldwide as the supplier of state of the art materials handling solutions, individually designed with the purpose of improving ergonomics, safety and productivity in manufacturing and Logistics. We boast extensive expertise in designing solutions that are compliant with the latest Directives, Standards and Guidelines on ergonomics and safety as well as Lean Manufacturing principles.

The INDEVA solutions range of products includes Intelligent Assist Devices, AGVs and Modular Structures.

AGV INDEVA have been chosen by large manufacturing companies in the Automotive, Mechanical, Electronic and Fashion Industries, because we provide our customers with expert, dedicated attention to their requirements from concept to commissioning and beyond.

Shown below is a layout of a typical AGV route in a manufacturing environment.

Precise and safe operation
Very definite logistic flow with fixed route. Operation 24/7 with no human intervention required. Elimination of the risks associated with use of forklift trucks.

Easy-to-assemble and easy-to-maintain
thanks to “all plugs” feature.

Advanced programming interface
Quick and easy programming by means of a touch panel or PC interface. Possibility to introduce interfaces with external input/output signals.

Higher speed and stability in turns
A closed loop control system enables precise tracking of the magnet guide tape without deviation or variation.

Flexibility
No conventional materials-handling infrastructures required. The number of AGVs can be increased as business grows. Updates are possible without shutting down the entire system. No damage caused by AGVs to goods, machinery or permanent structures. Work flow shared efficiently and dynamically between AGVs in use. Routes are easy to reconfigure if needed, new AGVs easily added.

Efficient, reliable and flexible transport

Optimum quality to price ratio
Low running and maintenance costs.

Functions of AGV technology
Compatibility with any type of automation. Traffic management system guaranteed to avoid collisions. Reintroduction of vehicles at any point of the system after being repositioned manually.

Annual costs comparison:
2 forklift trucks + operators vs. 5 AGVs

TECHNICAL DATA
Forklift trucks speed: about 6 km/h
AGV speed: about 2.4 km/h
Daily work hours: 8

300 M. MAGNETIC TRACK
+ PROGRAMMING
MAINTENANCE
OPERATOR
MACHINE

To carry out the tasks performed by 2 forklift trucks with operators travelling at an average speed of 6 km/h you need 5 AGVs travelling at 2 km/h.

Graphs showing total and average cost comparison over a period of 5 years. Average year cost over a 5 year period is 35% less for the AGV solution.
INDEVA AGV STANDARD MODELS

INDEVA AGV standard models range comprises Tugger AGV 750 -1500kg and Tunnel AGV 750kg.

Main features:
The AGVs follow a magnetic tape which is quickly and easily laid along the required route. Each standard AGV can be configured for different functions and can be upgraded from a range of optional accessories.

An INDEVA AGV is programmed for automatic start by means of either a preset timing or reception of a signal from customer’s line.

Comes complete with standard interfaces. Customer can use these to perform special functions or to control external devices.

INDEVA TUGGER AGV
750 - 1500kg

INDEVA TUGGER AGV is typically a standard product used to tow a train of trolleys. We can supply trolleys designed according to the materials to be moved.

INDEVA TUNNEL AGV
750kg

INDEVA TUNNEL AGV is used to move trolleys through the workshop and warehouse. This AGV positions itself beneath a trolley or cart that, using a fully automated pin-hook system, is then guided to the destination. At the destination, the AGV moves forward, automatically releasing the full trolley and hooking the empty trolley for return to the warehouse. This AGV is typically used when materials cannot be conveniently transferred from the trolley to the line rack. Towing capacity up to 750kg.

This AGV model is largely used to transport accessory kits from warehouse to the assembly line of automotive industries.
A custom built AGV INDEVA is designed specifically to meet special site and operational requirements regarding structure, layout, size and program.

Custom AGVs can be constructed to your exact specifications using either modular pipes and joints from our INDEVA Lean System range of components or a steel base structure.

Samples of custom solutions

The INDEVA AGV shown below is complete with power driven rollers for uploading large containers from the conveyor line that carries material between the warehouse and assembly line. It can carry loads up to 1500kg.

An INDEVA custom gravity AGV is used to transport boxes and small containers in both directions between the warehouse and assembly line. The loading/unloading of the boxes from/to the AGV is carried out with a completely automatic and simple mechanism using gravity to slide boxes from the AGV to the rack and vice-versa. The dimensions of the roller tracks are designed according to the size and the number of boxes to be carried.

We study in depth your material flow and requirements, then design solutions that best suit your product type and work cycles. We provide the complete program allowing the AGVs to perform all the required tasks.

These AGVs are equipped with custom made power driven conveyors, matched by similar conveyors at the load and offload positions. On arrival at correct location, the AGVs establishes contact with the conveyor using WI-FI. This sets both powered conveyors rotating at the same speeds so providing a smooth, controlled transfer of product. Potential applications are the transfer of heavy loads and fragile materials.

The kit is complete with safety light, battery charger and fully marked wiring for easy assembly; you can convert a trolley yourself with the help of the included manual or optionally by attending a training. Alternatively, we can do the job for you.

It is possible to purchase a kit of standard INDEVA modules to turn your trolley into an AGV.
### Power system

**Battery trolley**
Made with INDEVA Lean System modular structure. Very useful accessory for changing batteries: the battery smoothly slides unto the AGV and from the AGV to the trolley by means of roller tracks.

**Battery pack**
Spare standard batteries are available in 40Ah and 70Ah 24 volt DC. Batteries of different capacities are available on request.

**Trickle charger**
Each AGV crosses a charging point whilst travelling which helps to maintain the battery in a charged condition.
Recharging station with plate fixed onto the floor and item fixed on the AGV.

### Communication and Control System

**Supervisor and Controller**
It is the brain interacting with all the vehicles in the entire system: it receives from the AGVs information on their position and work parameters and controls crossings and overall traffic.

- controls AGV and all the other line component we supply such as roller conveyors, WI-FI start-stop, etc...
- controls crossings
- controls position on the route
- assigns the task to be completed by the AGV
- controls battery level and other parameters
- informs about failure and position of the AGV in case of unplanned stop.

**Wi-Fi Device**
You can equip your AGV with a WI-FI card to allow it to communicate with other devices, for example other AGVs, to control crossings or Start-Box, etc..

**WI-FI Start-Box**
Remote Push Buttons allows to start AGVs by means of WI-FI. This device can be installed near the operator, not on the AGV, in order to improve ergonomics for the operator. This accessory can be also used in order to interface an AGV with other machines on the line.

**Electronic Kanban**
Electronic Kanban system allows to assigns a preset task to an AGV. It is then possible to have the AGV perform this task at any time by simply activating a switch, either manually or automatically, from a remote position.

### Route and Markers

We design the route and lay the magnetic tape to your specific requirements.

**Magnetic markers**
Glued or resinated to the floor are the spots where each AGV must stop to carry out its tasks.

**RFID (Radio Frequency IDentification)**
System for the univocal identification of position so that an AGV can be added to the route without any external input.

**Trickle charger**
Each AGV crosses a charging point whilst travelling which helps to maintain the battery in a charged condition.
Recharging station with plate fixed onto the floor and item fixed on the AGV.

**Power system**

### Route and Markers

We design the route and lay the magnetic tape to your specific requirements.

**Magnetic markers**
Glued or resinated to the floor are the spots where each AGV must stop to carry out its tasks.

**RFID (Radio Frequency IDentification)**
System for the univocal identification of position so that an AGV can be added to the route without any external input.

**Trickle charger**
Each AGV crosses a charging point whilst travelling which helps to maintain the battery in a charged condition.
Recharging station with plate fixed onto the floor and item fixed on the AGV.
We can design and manufacture custom trolleys for the AGV INDEVA TUGGER and the TUNNEL. We can give guidance in the design and manufacture of the trolleys and the best system for the automatic loading/unloading of materials.

Custom trolley can be made with steelwork.

Trolley structure can be made with the modular pipes and joint system. This allows to build it to your exact specifications, at a reduced cost.

Custom U-shaped base to lodge trolleys. This system allows quick trolley replacement without need to unhook the trolley from the train.

A convoy consisting of a tractor and several trailer trolleys can travel more easily and safely when all vehicles move along the same trajectory. Our auto-synchronised steering system, made with high precision rigid guide bars, needs no maintenance and guarantees that the entire convoy will follow a single track, with gaps of only a few millimeters.

The design begins by studying the floor plan and cargo size, to identify the best possible route to suit the turning circle of the train.

---

**Safety and certifications**

All AGV INDEVA, both standard and custom, are CE certified and comply with all safety, Ergonomics and European Quality Standards, Directives and Regulations, in particular Directive 2006/42/EC. Certifications cover the route and all relative risks.

A class 3 Laser Scan system with 8 (for standard models) or 16 (for some custom models) zones guarantees perimeter safety control.
